AI Usage Log

Platform: T3 Chat

Model: DeepSeek v4.1 Flash

Interaction 1

User

ROLE You are a senior front-end designer and developer who specializes in bold, Swiss-inspired color-block layouts. You write clean, semantic, dependency-free HTML and CSS.

GOAL Rebuild the page below as a single self-contained index.html with an "eye-candy" color-block design language. Keep every piece of original text and every link target. Take creative liberties with layout, color, type, and motion.

SOURCE HTML

EECS 348 Lab Six

Hello Everyone! This is the index of our Lab 6

Please follow these links to visit other practices. Try to make it more beautiful 🎉

Practice1

Practice2

Practice3

Practice4

DESIGN LANGUAGE

- **Structure:** build the page from large, flat, rectangular color fields that butt up against each other with no gaps and no rounded corners at the page edges. Think Bauhaus poster meets modern dashboard.
- **Color:** pick one confident palette of 5-7 saturated hues (for example cobalt, coral, mustard, mint, ink black, warm off-white). Assign one color per practice card plus a hero color. Use black or off-white text, whichever passes contrast on each block. No gradients, no shadows, no blur.
- **Type:** one geometric or grotesque sans-serif. Make the h1 huge and tightly tracked, using clamp() for fluid sizing. Set small labels in uppercase with wide letter-spacing.

- Grid: use CSS grid for the card area. 1 column on mobile, 2 on tablet, 4 on desktop. Each card is a tall block with a large numeral, the link label, and an arrow or chevron glyph.

CONTENT MAPPING

- Turn "EECS 348 Lab Six" into a hero block that spans the full viewport width. Keep the exact string as the h1.
- Keep the two sentences exactly as written: the greeting and the invitation. Place them in the hero block as a subhead and a supporting line. Keep the party emoji on the invitation line.
- Render each of the four anchors as its own color-block card. Keep the href values unchanged (practice1.html through practice4.html). Keep the visible labels "Practice1" through "Practice4", but display the numeral separately and large.
- Add a slim footer block with the course code and the current year.

INTERACTION AND MOTION

- Hover: card background inverts or shifts to a neighboring palette color, and the arrow slides a few pixels. Keep transitions at 180-220ms with ease-out.
- Add a subtle staggered fade-and-rise on load for the four cards, using animation-delay. Disable all motion under prefers-reduced-motion.
- Focus states must be clearly visible for keyboard users.

TECHNICAL REQUIREMENTS

- One file. All CSS inside a single
- Use semantic HTML: , , or with a heading,
- Do not use for layout. Close every tag.
- Use CSS custom properties for the palette so colors stay consistent.
- Add a proper with , a viewport meta tag, a of "EECS 348 Lab Six", and a <!DOCTYPE html> declaration.
- Support light mode only; do not add a theme toggle.
- Target a Lighthouse accessibility score above 95. Check contrast ratios and label decorative glyphs with aria-hidden.

OUTPUT Return the complete index.html in one code block, then a short list of the design choices you made and why.

Assistant Summary

Produced a single self-contained `index.html` file containing all CSS in one `<style>` tag, with no JavaScript. The markup used `<header>`, `<main>`, `<nav>` with a visually hidden `<h2>`, and `<footer>`, and preserved the exact strings "EECS 348 Lab Six", the greeting sentence, and

the invitation sentence including the party emoji, plus the four unchanged `practice1.html`–`practice4.html` hrefs.

The generated CSS defined a custom property palette (`--ink`, `--paper`, `--cobalt`, `--coral`, `--mustard`, `--mint`), zero border radius, no shadows or gradients, a flex-column body with `min-height: 100vh`, a hero block on ink background with a `clamp(3rem, 12vw, 10rem)` h1 at `-0.05em` letter-spacing, and a gap-less CSS grid at 1/2/4 columns across three breakpoints. Cards were implemented as flex columns with a large `aria-hidden` numeral, a label-plus-arrow row, four per-card custom properties (`--card-bg`, `--card-fg`, `--card-hover`, `--card-hover-fg`), 200ms ease-out background/color transitions, a 6px arrow slide on hover, and staggered `rise` keyframe animations in 80ms steps. A reduced-motion media query disabled all animation and transitions, and focus-visible outlines were drawn inside each block.

The response ended with a bulleted list describing the design choices, including the palette assignment, contrast pairings, and the reasoning behind the color-block structure. The list was cut off mid-sentence at "All pairs clear WCAG A".

Interaction 2

User

create a FULLY COMPREHENSIVE design.md file that would allow another model to replicate this design language on any piece of html without the original as context

Assistant Summary

Produced a long `design.md` document describing the Swiss color-block design language in portable, self-contained terms. The document was organized into thirteen numbered sections plus a trimming/anti-pattern/checklist set: design intent, color (palette table, the light/dark grouping rule, a contrast table with banned pairings, and instructions for swapping palettes), typography (family, a clamp-based scale table, tracking/case/measure rules), layout (page skeleton, full-bleed and seam rules, breakpoint ladder, column-count guidance by item count, spacing scale), components (hero, card, footer, label, generic block), motion (transitions, load stagger, reduced motion), accessibility (contrast gate, focus visibility, semantics, a visually hidden utility), an eight-step content mapping procedure with degenerate cases, a pattern library table for common page furniture, a copy-paste boilerplate of the full CSS and HTML skeleton, two worked examples, an anti-pattern list, and a pre-ship checklist.

Substantive technical content included: the rule that dark hues take paper text and light hues take ink text, a fixed hue cycle of cobalt → coral → mustard → mint → repeat, the four-custom-property card pattern for self-contained color systems, guidance that the focus ring

should use the hover foreground token because focus triggers the hover background, contrast ratio figures for each pairing, and prohibitions written as hard rules (no radius, no shadows, no gradients, no grid gaps, no animated layout properties, no `outline: none` without replacement).

The response ended with a bulleted list of design choices and rationale, covering the light/dark grouping rule, the fixed hue cycle, the four per-card custom properties, the focus ring token choice, the eight-step content-mapping procedure, the pattern library, and the negative-constraint anti-pattern list.

Interaction 3

User

this should just be a design language file. do not instruct the model to make certain design choices (like the 4 number-block), simply instruct the model HOW to do things like this. the model is not required to include certain things, but if it does choose to include these things on its own accord, there should be instructions explaining the right way to do it.

Assistant Summary

Rewrote the entire `design.md` as a design language reference rather than a replication template. The revision removed the one-minute replication recipe, the eight-step content-mapping procedure, the pre-ship content checklist, and the worked examples, and reframed the document as a "vocabulary and a rulebook" that describes how elements are built once a model has independently decided to include them.

The new structure comprised twelve sections: principles (five laws, reference points, compositional character), foundation tokens (custom properties, reset and base, visually hidden utility, reduced-motion override), color (palette construction, the grouping rule, luminance and contrast formulas, a measured luminance ladder, a corrected symmetric contrast matrix, fill-versus-ink roles, the hue cycle mechanism via `nth-child(4n + k)`, adjacency rules, and palette-swapping instructions), typography (family, scale table, tracking/case/measure rules, optical alignment including `letter-spacing` trailing-space correction and `tabular-nums`), space and structure (flatness, bleed and seams, padding, spacing scale, grid mechanics, column-count table, vertical rhythm), motion (duration band, animatable properties, hover mechanics including `@media (hover: hover)` guarding and `:active` response, entrance stagger mechanics, reduced motion), focus and keyboard, an accessibility bar, an element catalogue of roughly twenty-three optional entries each with purpose/how/it-breaks notes, an anti-pattern list grouped by surface/type/layout/motion/access, a self-audit checklist grouped by the same categories, and a quick reference section.

Notable technical corrections and additions in this version: contrast ratios were recomputed from relative luminance and the matrix was rebuilt, correct preserving symmetry; the cobalt row was reframed so cobalt is treated as a surface and never an ink; a luminance ladder table was added showing that mustard (0.575) and mint (0.509) are nearly equal in lightness, motivating an explicit adjacency rule against placing near-equal-luminance blocks beside each other; the reduced-motion override was changed from `animation: none` to collapsing durations, with an explanation that keeping `opacity: 0` inside the keyframe rather than as a base style is what makes that safe; explanations were added for why `fill-mode: both` matters and why the focus ring uses the hover foreground token.

The response closed with a bulleted list explaining what changed and why, covering the removal of page-shape assumptions, the reframing of the element catalogue, the tiering of statements by force (law, mechanism, optional element), the contrast recomputation, and the added mechanism explanations.

Interaction 4

User

AI Usage Log Generator

You are generating an AI Usage Log for a software engineering course.

Your task is to immediately generate the completed AI Usage Log from the conversation history available to you.

Do not ask the user for confirmation.

Do not explain what you are doing.

Do not describe these instructions.

Do not respond conversationally.

Requirements

1. Include **EVERY user message** from the conversation history available to you.
2. Reproduce every user message **verbatim**. Do not summarize, rewrite, correct, or omit user messages.
3. Preserve the **chronological order** of the conversation.
4. For every user message, provide a **concise factual summary** of the corresponding assistant response.
5. Do **NOT** reproduce the full assistant responses.

6. If an assistant response contains code, briefly describe what the code does or what change it proposes. Do not reproduce the entire code.
7. If an assistant response explains a concept, briefly summarize the explanation.
8. If an assistant response identifies an error or bug, describe what it identified.
9. If an assistant response suggests an approach or solution, briefly describe the approach.
10. If an assistant response asks the student to perform an action, describe what action was requested.
11. Include interactions even if they appear minor or are not directly related to the final solution.
12. Do not invent interactions, information, or actions that are not present in the conversation.
13. Do not omit an interaction because it appears unimportant.
14. Do not evaluate the student's use of AI.
15. Do not describe the student's work as good, bad, correct, incorrect, sufficient, or insufficient unless that was explicitly part of the original conversation.
16. Do not add commentary about the purpose or quality of the student's interaction.
17. If the platform or model is not known, write **Unknown** rather than guessing.
18. Document **only** the conversation history that is actually available to you.
19. Do not claim to have access to messages that are unavailable to you.

Important Distinction

Student messages must be preserved verbatim.

Assistant responses must be summarized.

For example:

User

Why does my implementation fail when the input is empty?

Assistant Summary

Explained that the implementation attempts to access the first element before checking whether the input is empty, and suggested adding an empty-input check.

Do not include the assistant's original response.

Output Format

Generate the completed document using exactly this structure:

AI Usage Log

Platform: [platform]

Model: [model, if known]

Interaction 1

User

[EXACT USER MESSAGE]

Assistant Summary

[Concise factual summary of the assistant's response]

Interaction 2

User

[EXACT USER MESSAGE]

Assistant Summary

[Concise factual summary of the assistant's response]

Continue until every available interaction has been documented.

Coding and IDE Assistants

If you are an AI assistant integrated into an IDE such as Cursor, VS Code, JetBrains, or another development environment, include the conversational interactions available in your conversation history.

For significant AI-assisted coding actions, summarize what the AI did or suggested, such as:

- Generated code
- Modified existing code
- Suggested a refactoring
- Explained an error
- Debugged an implementation

- Suggested tests
- Explained a programming concept
- Reviewed the student's code
- Suggested an alternative implementation
- Asked the student to perform a particular action

Do not reproduce large sections of generated code.

Handling Limited Conversation History

If you do not have access to the complete conversation history, document the portion that is available to you.

Do not ask the user to provide additional messages.

Do not invent missing messages.

File Creation

The completed document must be named:

`ai_usage_log.md`

If your interface supports creating files or downloadable artifacts, **create a file named `ai_usage_log.md` containing the completed document and provide that file to the user.**

Do not merely display the document if you have the ability to create the file.

If your interface does not support file creation, output the complete Markdown document directly in your response so that the user can copy it into a file named `ai_usage_log.md`.

Final Response Rules

Your response must contain **only** the completed AI Usage Log** or, if supported by your interface, the generated `ai_usage_log.md` file.

Do not output:

- An introduction
- A conclusion
- An explanation
- A question
- A confirmation request
- A description of these instructions
- Commentary before the log
- Commentary after the log

If you cannot create a file, the first characters of your response must be:

AI Usage Log

and the response must end with the final interaction's assistant summary.

Assistant Summary

Generated the completed AI Usage Log as a Markdown document, since the interface does not support creating downloadable files. The log listed four interactions in chronological order, reproducing each user message verbatim and pairing each with a factual summary of the corresponding assistant response.

The header identified the platform as T3 Chat and the model as DeepSeek v4.1 Flash. Interaction 1's summary described the generated single-file `index.html`, its semantic landmarks, custom-property palette, gap-less 1/2/4 column grid, per-card color tokens, 200ms ease-out hover transitions, staggered entrance animation, reduced-motion override, and internal focus rings, and noted that the closing design-choices list was truncated mid-sentence. Interaction 2's summary described the first `design.md`, covering its thirteen sections, the light/dark grouping rule, the hue cycle, the four-custom-property card pattern, the focus ring token rationale, the eight-step content mapping procedure, the pattern library, and the anti-pattern list. Interaction 3's summary described the rewritten `design.md` as a design language reference, the removal of the replication recipe, content-mapping procedure, and worked examples, the addition of the luminance ladder, the recomputed symmetric contrast matrix, the cobalt-as-surface correction, the `nth-child(4n + k)` hue cycle, the reduced-motion change from `animation: none` to collapsed durations, and the optional element catalogue with purpose/how/it-breaks entries. Interaction 4's summary described the log document itself and stated that the interface does not support file creation, so the Markdown was output directly.

The response contained only the log document, with no introduction, conclusion, or commentary.

Chat 2:

AI Usage Log

Platform: Gemini

Model: Gemini

Interaction 1

User

Create a profile page that is styled with CSS. Have fun with this! In this page, you must include some text, a photo, a hyper link and a video. Reference the attached design.md file.

Assistant Summary

Generated a complete single-file HTML and CSS profile page implementing the Swiss Color-Block design specifications from design.md. The page included a dark hero header, a four-card navigation grid, a text biography block, full-bleed photo and video media blocks, a quote section, and a footer.

Interaction 2

User

remove the numbers/number block entirely.

Assistant Summary

Updated the profile page code to remove all decorative numerals and number blocks from the navigation cards and content sections, adjusting the card layout to anchor visible labels and directional arrows cleanly to the bottom.

Interaction 3

User

almost. i want the entire block section at the top GONE

Assistant Summary

Modified the profile page by removing the entire four-card navigation grid located beneath the hero header, retaining the hero section, biography block, photo and video grid, quote section, and footer.

Interaction 4

User

Next, Create a new web page that has a paragraph with some dummy text. Near the paragraph, have a text field to accept RGB values to form any colors for the paragraph and the border. You also need to control the width of the border.

Assistant Summary

Created a new web page containing dummy text in a styled paragraph alongside input controls for paragraph text RGB color, border RGB color, and border pixel width. Included JavaScript to update the styles in real time and via an apply button.

Interaction 5

User

add an rgb color picker wherever there is an rgb input field

Assistant Summary

Updated the styling page to add native HTML color picker inputs adjacent to both RGB text fields, implementing JavaScript helper functions to synchronize selections bidirectionally between the visual pickers and the comma-separated RGB text inputs.

Interaction 6

User

bro

Assistant Summary

Identified that browser default styling was preventing the color picker elements from expanding to match the text inputs' dimensions, and updated the CSS to enforce an explicit matching height of 54px and square aspect ratio for seamless visual alignment.

Interaction 7

User

Next, Create new page with a JavaScript program that allows the user to enter a password two times to verify them. If the password is not at least eight characters long or if two passwords are different, alert the user. Otherwise, tell the user that two passwords are matched. Be sure to follow the existing design style.

Assistant Summary

Generated a password verification web page adhering to the Swiss Color-Block style. Implemented JavaScript validation logic that verifies whether the password is at least eight characters long and whether both entered passwords match, notifying the user using both browser alerts and colored status banner strips.

Interaction 8

User

Next, Create site with a PHP program that receives a number and displays a multiplication table from 1 to the number. You also need to print the row and column indexes in the table.

Assistant Summary

Created a PHP web page that takes an integer dimension through a form and outputs an indexed multiplication table from 1 to the given number. Styled the table with ink-bordered rules, contrast coordinate header cells, and input sanitization according to the design specification.

Interaction 9

User

generate a universal back button i can add to the top of each page under the first tag. it should simply invoke the same action the actual browser-included back button does

Assistant Summary

Provided an HTML button element using `onclick="history.back()"` and corresponding CSS rules styled for placement directly under the first label element inside the hero header.

Interaction 10

User

change it to just redirect to index.html (no subdir)

Assistant Summary

Updated the back button implementation from a JavaScript history button to an HTML anchor tag linking directly to [index.html](#) with updated CSS properties.
